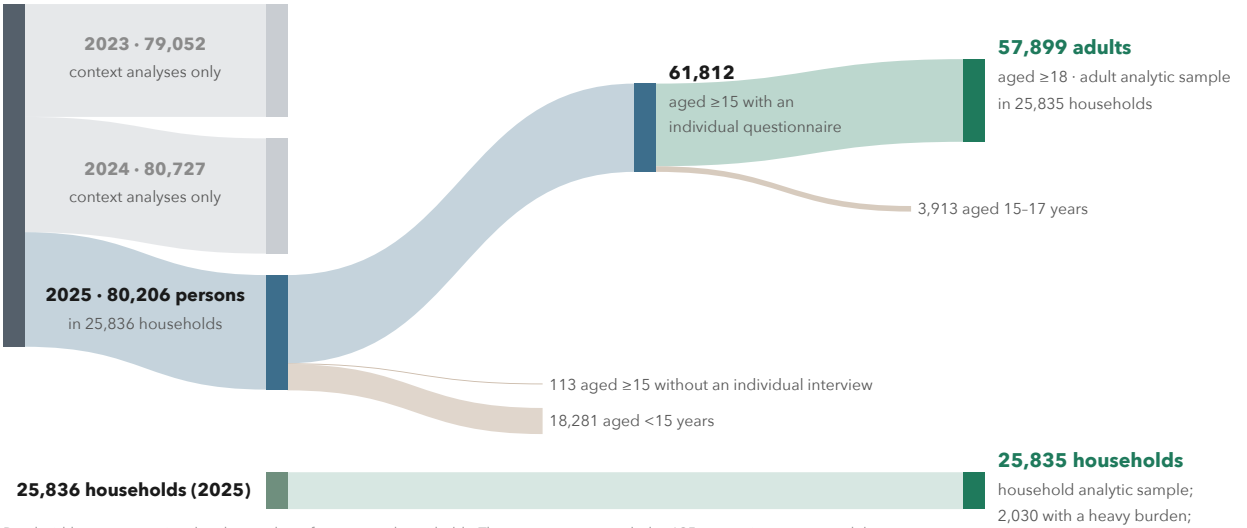
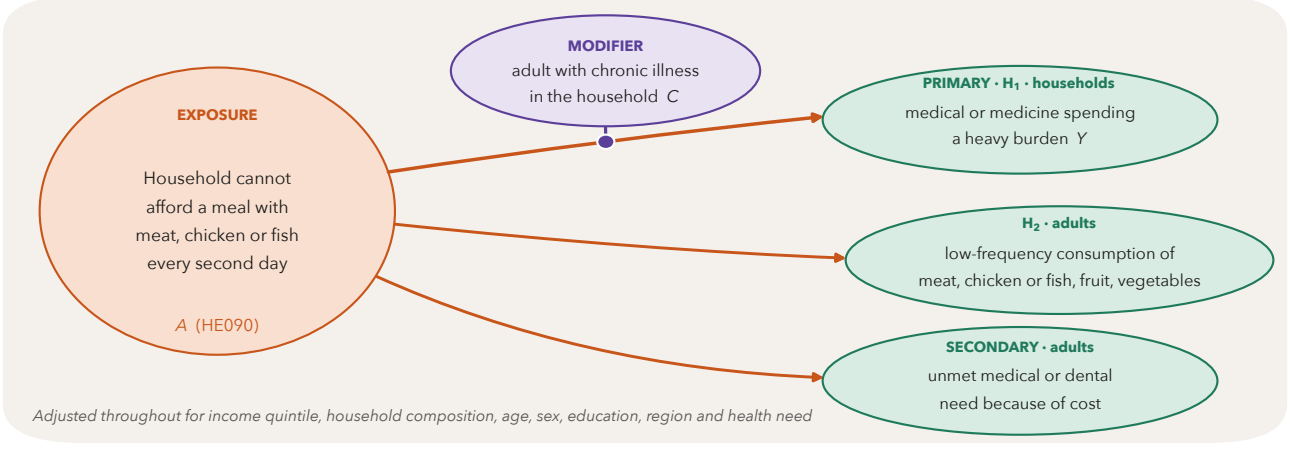
(a)



Band widths are proportional to the number of persons or households. The meat outcome excludes 195 vegetarian or vegan adults; unmet-need analyses use the 53,434 adults reporting a medical care need.

(b)



Estimands H_1 $\Delta = p_{11} - p_{10} - p_{01} + p_{00}$ and RERI $= \Delta / p_{00}$ H_2 PD $= p_1 - p_0$, PR $= p_1 / p_0$

standardized prevalences from survey-weighted models with g-computation; household bootstrap intervals

1. **Describe** — 2025 profile, 2023–2025 context
2. **Model** — weighted logistic, g-computation
3. **Profile** — latent classes, three-step BCH
4. **Stress-test** — sensitivity analyses
5. **Simulate** — plasmode precision, bias, clustering
